USER GUIDE

HAIR SERVICE PRICING GUIDE

How to use your calculator, step by step

- Price every service so it pays your staff, your bills and you
- Find the right commission to pay your workers
- Know how much discount you can give without losing money

For ventilation, wigmaking, revamping, installation, styling and any other hair service.

BEFORE YOU START

Go to **deesglim.shop/pricing-guide**, sign in with the email you used to buy, and tap **Open your calculator**. It works on your phone or laptop, on up to two devices at a time. Bookmark it, or on your phone tap Share › Add to Home Screen, so you can find it again.

Have these ready

- **Your monthly bills:** rent, electricity, fuel, data, salaries, marketing.
- **What you buy for each service:** what each item cost you and roughly how many jobs it lasts.
- **Your current prices** for each size or length.
- **Roughly how many jobs** you do each month for each service.
- **What you pay staff** per job, if you already pay them.

Every price is made of four parts

1 · DIRECT COST
What one job uses up: lace, thread, products, wig cap, packaging, and a little of your tools each time.

2 · COMMISSION
What you pay the person who does the job, as a percentage of the price.

3 · RUNNING COSTS
Rent, light, fuel, salaries and marketing. Every job pays a small share.

4 · PROFIT
What is left for you. A healthy hair business keeps 40–50%.

PRICE – DIRECT COST – COMMISSION – RUNNING COSTS = YOUR PROFIT

GOOD TO KNOW

The calculator opens with example numbers so you can see how it works. Replace them with yours. Your entries save automatically on the phone or laptop you use, so always use the same device and browser.

1 MONTHLY RUNNING COSTS

These are the bills you pay every month, whether you get ten orders or none.

- Type each bill and its monthly amount. Change the names to match yours.
- Tap **Add a cost** for anything missing, like cleaning, pick-ups or a phone line.
- Tap ✕ to remove a line you don't pay.
- Paid yearly? Divide by 12. A ₦60,000 yearly subscription is ₦5,000 a month.

PAY YOURSELF TOO

If you take a monthly salary from the business, add it here as a running cost. Otherwise the calculator will count your salary as profit.

2 YOUR GOALS

- **Profit you want to keep:** start with 40–50%. Below 30% leaves you little room for mistakes, slow months or discounts.
- **Discount you want to offer:** the % off you plan for a sale, a bundle or wholesale customers. For example 10%.

Two numbers appear under your goals

Expected sales per month adds up your price × jobs per month for every service.

Running costs take shows how much of every ₦1 you earn goes to bills. If your bills are ₦755,000 and you sell ₦4,741,000 a month, bills take 16%. Every job then gives 16% of its price to your bills.

3 YOUR SERVICES

Each service has its own card. Keep only the services you offer: tap **Remove service** on the others, and **Add a service** for anything new, like installation, colouring or braiding.

A · What one job uses up

List every item the service uses, what you paid, and how many jobs it lasts. The calculator works out the cost per job.

ITEM	COST	JOBS IT LASTS	COST PER JOB
Shampoo	₦13,500	30	₦450
Wig cap	₦800	1	₦800
Block head	₦20,000	100	₦200

Items used up on every job (wig cap, elastic band, packaging) last 1 job. Tools (block head, flat iron, cradle) last many jobs, so each job carries only a small part of their cost.

B · Your sizes, lengths or options

- **Option:** the size or length, like 13×6 frontal, 18–28 inches, or frontal install.
- **Your price:** what you charge the customer.
- **Extra cost for this option:** anything only this size uses. For ventilation, this is the lace for that size: what you paid for the lace ÷ how many pieces of that size you get from it, plus cutting.
- **Jobs per month:** roughly how many you do. This is used to share your bills fairly.

C · Staff commission

- **You already have a % in mind?** Type it. The calculator tells you the most you can afford on every option and whether your % works.
- **Not sure?** Leave it empty and the calculator suggests one. It suggests up to 20% of the price, but never more than you can afford while keeping your profit goal.

PAYING A FIXED AMOUNT INSTEAD?

If you pay ₦5,000 per job on a ₦25,000 service, your commission is ₦5,000 ÷ ₦25,000 = 20%.

READING YOUR RESULTS

Each option fills in these columns as you type.

COLUMN	WHAT IT MEANS
Direct cost	Materials per job + the extra cost for this option.
Commission	What you pay your worker for this job.
Running costs share	This job's part of your monthly bills.
Your profit	What you keep from this job after everything.
Profit %	Your profit as a share of the price, coloured by how it compares with your goal.
Lowest price for your goal	The least you should charge for this option and still keep your profit goal. If your price is below this, raise it.
Discount price	Your price with your discount taken off.
Profit at discount	What you keep if you sell at the discount price. If this turns red, don't discount this option.

The colours

50% Green: at or above your profit goal.

32% Orange: making money, but below your goal.

−8% Red: you lose money on every one of these jobs.

4 YOUR MONTH AT A GLANCE

The last table adds up each service: jobs, sales, commission paid and profit, then the whole business at the bottom. It shows which services carry your business and which ones need fixing.

A WORKED EXAMPLE

Closure wigmaking at ₦30,000, with a 50% profit goal, using the example numbers in the calculator.

PART	HOW IT'S WORKED OUT	AMOUNT
Price	What the customer pays	₦30,000
Direct cost	Thread ₦33 + needles ₦67 + elastic band ₦800 + wig cap ₦800 + packaging ₦500	− ₦2,200
Commission	Suggested 20% of ₦30,000	− ₦6,000
Running costs	Bills take 16% of sales: 16% of ₦30,000	− ₦4,777
Profit	**What you keep**	**₦17,023 · 57%** on target

Lowest price

To keep 50% while paying 20% commission, this wig must sell for at least **₦16,000**. At ₦30,000 there is plenty of room.

With 10% off

Sale price ₦27,000. The worker gets 20% of ₦27,000 = ₦5,400. You still keep **₦15,100 (56%)**, so this discount is safe.

FIXING ORANGE OR RED

1. **Raise the price** to at least the "lowest price for your goal".
2. **Lower the commission**, or pay a fixed amount that works out to a smaller %.
3. **Cut a cost:** buy in bulk, or find a product that lasts more jobs.
4. **Do more jobs:** your bills stay the same, so each job carries less of them.
5. **Don't discount that option** if its profit at discount turns red.

QUESTIONS

It says this device was signed out.

Your guide works on two devices at a time. Opening it on a third signs out the oldest one. Tap **Sign in again** to use it on this device.

Where are my numbers saved?

On the phone or laptop and browser you typed them on. They don't move to another device. If you clear your browser data or use private browsing, they are cleared too, so write your final numbers down.

I deleted something by mistake.

Add it again with the Add buttons. **Reset to example** brings back the original examples, and it also clears everything you typed.

How often should I update it?

Whenever a price changes: rent goes up, lace or products cost more, or you change what you pay staff. Check it at least every three months.

My profit looks too high to be true.

Check that every monthly bill is in step 1, including your own salary, and that every item a job uses is listed in its service. Missing costs are the most common reason prices end up too low.

REMEMBER

A busy business can still lose money if its prices are wrong. Price every service on purpose, review it often, and never discount an option that turns red.
